

The 3 Hard Boundaries for AI in Revenue Cycle

Why generative AI must never guess clinical codes.

Sovereign Trust: How modern healthcare platforms protect HIPAA & compliance while scaling globally.

Zero Code Hallucination

Deterministic rules vs black-box generative models.

- **The Risk:** LLMs guessing CPT or ICD-10 codes trigger Medicare fraud audits.
- **The Safeguard:** AI is architecturally forbidden from inventing codes or modifying dollar amounts.
- **Verification:** Strict NCCI edit cross-referencing and AAPC certified human sign-off.

Locked-Down VDI Delivery

Zero local PHI downloads overseas.

- **US Data Residency:** Patient records never leave US HIPAA-compliant cloud regions.
- **No Local Storage:** USB ports, clipboard sharing, and local disk writes blocked by code.
- **Access Control:** MFA + role-based least privilege on every clinical record.

Tamper–Evident Audit Trails

Cryptographic lineage for every billing action.

- **Immutable Ledger:** Every claim scrub, rule check, and appeal is hash-chained.
- **10–Second Audit Packet:** Instant compliance documentation for commercial and CMS auditors.
- **No Retrospective Edits:** Historical decisions are mathematically verifiable.

Trust Before Scale

Global efficiency only wins when institutional trust is unshakeable.
